

## Description

1. Be composed of the time that 2 S voltage output , C1 capacitance decision among them export from Q1 , Q2 audion and vicinity circuit

2. 4th foot only is capable to do the automation output signal giving Q4 , two audion and vicinity component composition oscillating, modulate , enlarge Q4 and Q3 when  $y_{in} = 33.3$  meter of 1527 IC feet should have voltage over, a signal is dispatched again after air wire going out.
